

I am writing to recommend Gabriel Alves, who worked as an intern at Valuedate over the past 3 months, between June and September 2026, demonstrating a level of autonomy and responsibility that clearly exceeded what would be expected at this stage of his career.

From the outset, Gabriel showed a remarkable ability to adapt to tools that were entirely new to him, such as Django and Playwright, as well as to a large and complex codebase, without any structured onboarding process. He became productive within days, a learning pace rarely seen in an intern.

This autonomy was evident from the very first project assigned to him. Gabriel identified and fixed several issues entirely on his own, including an authentication bug within his first days, and implemented improvements at both the UI/UX and backend logic levels, notably correcting the encryption method used for messages sent to a vault, which had been incorrectly implemented using symmetric encryption for that use case, and which Gabriel corrected to asymmetric encryption.

It was also Gabriel who, on his own initiative, introduced the use of Playwright to the team, a framework that has since been adopted on another internal project (Concierge), reflecting an impact that clearly extended beyond the scope of his own work.

Throughout the internship, he also stood out for his critical thinking oriented toward user experience, putting forward concrete improvement suggestions, such as proposing that certain interface filters be made reactive, updating only the relevant data instead of requiring a full page reload.

Alongside the technical component, Gabriel communicated clearly at all times, both in his pull requests and by showing quick availability to organize a video call to walk the team through setting up and running the tests he had developed, ensuring continuity of the work even without his direct involvement.

The point I most want to highlight, however, is the full responsibility Gabriel took on for the test suite of two separate projects, 1partilha.com and Concierge (<https://con.cierge.app>), from defining the testing methodology and structure through to execution, always with complete autonomy and no need for direct supervision. In practice, this represented a level of ownership we would normally only expect from someone with already consolidated experience, not from an intern in their first professional experience.

I recommend Gabriel for any team or project that values genuine autonomy, accelerated learning ability, and real technical responsibility, qualities that, in my experience, are hard to find even in more senior profiles.
